Table 8: Task Programs

Semantics

Environment Variables

TOKEN: A string constant containing the information linking ScrumBot to Discord's API

State Variables

startup_extensions: A list of command cogs.

State Invariant

None

Assumptions

This module is the interface between the users and the code. The input taken for the export access programs are text-based commands in Discord, and the output is also in text channels as text output. The methods also keep an output in the terminal as a log of commands used.

The exception to this assumption is the access routine on_ready as the output for the method is found in the terminal only. Due to this, there is no output value in the exported access programs table.

Though it is comprised of multiple files with many different purposes, the main purpose for these files are the same. For this reason, they have been grouped together into one module, with the secret being communication between the client from Discord and the system.

It is assumed that author refers to the user that initiated the command.

Access Routine Semantics

ScrumBot Programs
on_ready()

- transition: waits for ScrumBot to connect to Discord's API servers using the TOKEN, and upon successful connection, will print out the bot's name and id to the terminal. It is a check for successful connection to the server.

Admin Programs
load(*cog*)

- transition: attempts to load a Cog into ScrumBot through the use of the command `load_extension(cog)`

- output: out := ($exc \Rightarrow$ "Error: failed to load" || cog | $\neg$ $exc \Rightarrow cog$ || "loaded")
- exception:

	exc :=
author_role $\neq$ admin	MissingRole
any issue with loading cog	Exception

reload(cog)

- transition: attempts to reload the cog in ScrumBot through unloading the cog then loading the cog
- output: out := ($exc \Rightarrow$ "Error: failed to reload" || cog | $\neg$ $exc \Rightarrow cog$ || "reloaded")
- exception:

	exc :=
author_role $\neq$ admin	MissingRole
any issue with unloading or loading cog	Exception

unload(cog)

- transition: attempts to unload a cog from ScrumBot
- output: out := ($exc \Rightarrow$ "Error: failed to unload" || cog | $\neg$ $exc \Rightarrow cog$ || "unloaded")
- exception:

	exc :=
author_role $\neq$ admin	MissingRole
any issue with unloading cog	Exception

Member Programs
get_roles()

- transition: finds all roles that are assigned to the author
- output: out := a discord.embed such that it contains the chosen author's name, icon, and a list of their roles

get_roles($name$)

- transition: takes in the name of a Discord user and finds all roles that are assigned to that user
- output: out := a discord.embed such that it contains the chosen user's name, icon, and a list of their roles

Project Programs
add_meeting($n, name, date, time, meeting$)

- transition: new Meeting($name, date, time, meeting$), add it to project n using add_meeting
- output: out := ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" | $\neg\ exc \Rightarrow$ "Successfully added meeting")
- exception: exc := author_role $\neq$ Scrum Master $\Rightarrow$ MissingRole

add_meeting($n, name, date, time, meeting, desc$)

- transition: new Meeting($name, date, time, meeting, desc$), add it to project n using add_meeting
- output: out := ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" | $\neg\ exc \Rightarrow$ "Successfully added meeting")
- exception: exc := author_role $\neq$ Scrum Master $\Rightarrow$ MissingRole

add_project($name$)

- transition: new Project($name$)
- output: out := ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" | $\neg\ exc \Rightarrow$ "Successfully added project")
- exception: exc := author_role $\neq$ admin $\Rightarrow$ MissingRole

add_project($name, desc$)

- transition: new Project($name, desc$)
- output: out := ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" | $\neg\ exc \Rightarrow$ "Successfully added project")
- exception: exc := author_role $\neq$ admin $\Rightarrow$ MissingRole

add_rqe(n, s)

- transition: add_rqe(s) in project n
- output: out := ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" | $\neg\ exc \Rightarrow$ "Successfully added requirements")
- exception: exc := author_role $\neq$ Business Analyst $\Rightarrow$ MissingRole

add_sprint(n)

- transition: new Sprint(), then add the sprint to project n using add_sprint(sprint)
- output: out := ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" | $\neg\ exc \Rightarrow$ "Successfully added a sprint")

- exception: $exc :=$ author_role $\neq$ Scrum Master $\Rightarrow$ MissingRole

get_project_desc(n)

- output: $out :=$ A discord.embed such that it contains the project name and description of project n

get_rqes(n)

- output: $out :=$ A discord.embed such that it contains the project name and list of requirements of project n

get_sprints(n)

- output: $out :=$ A discord.embed such that it contains the project name and list of sprints of project n

list_meetings(n)

- output: $out :=$ A discord.embed such that it contains the project name and list of meetings of project n, as well as show the times for all the meetings

list_projects()

- output: $out :=$ A discord.embed containing all the created projects, identified by their name

rm_last_sprint(n)

- transition: removes the last sprint of project n using rm_sprint()
- output: $out :=$ ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" $\mid \neg\ exc \Rightarrow$ "Successfully removed a sprint")
- exception: $exc :=$ author_role $\neq$ Scrum Master $\Rightarrow$ MissingRole

rm_meeting(n, m)

- transition: removes a meeting from project n using rm_meeting(m)
- output: $out :=$ ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" $\mid \neg\ exc \Rightarrow$ "Successfully removed a meeting")
- exception: $exc :=$ author_role $\neq$ Scrum Master $\Rightarrow$ MissingRole

rm_project(n)

- transition: removes a project by their project id using remove(n)

- output: out := ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" | $\neg\ exc \Rightarrow$ "Successfully removed a project")
- exception: exc := author_role $\neq$ admin $\Rightarrow$ MissingRole

rm_rqe(n, m)

- transition: remove requirement m from project n using rm_rqe(m)
- output: out := ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" | $\neg\ exc \Rightarrow$ "Successfully removed a requirement")
- exception: exc := author_role $\neq$ Business Analyst $\Rightarrow$ MissingRole

set_project_desc(n, s)

- transition: set_desc(s) in project n
- output: out := ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" | $\neg\ exc \Rightarrow$ "Successfully set description")
- exception: exc := author_role $\neq$ Business Analyst $\wedge$ author_role $\neq$ admin $\Rightarrow$ MissingRole

Meeting Programs
get_meeting_desc(n, m)

- output: out := A discord.embed such that it contains the meeting description of meeting m in project n, showing the meeting name and project name as well

set_meeting_desc(n, m, s)

- transition: set_desc(s) for meeting m in project n
- output: out := ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" | $\neg\ exc \Rightarrow$ "Successfully set description")
- exception: exc := author_role $\neq$ Scrum Master $\Rightarrow$ MissingRole

Sprint Programs
add_task($n, m, name, date, time$)

- transition: new Task($name, date, time$) then add_task(task) in sprint m, project n
- output: out := ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" | $\neg\ exc \Rightarrow$ "Successfully added task")
- exception: exc := author_role $\neq$ Scrum Master $\Rightarrow$ MissingRole

add_task($n, m, name, date, time, detail$)

- transition: new Task($name, date, time, detail$) then add_task(task) in sprint m, project n
- output: out := ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" | $\neg\ exc \Rightarrow$ "Successfully added task")
- exception: exc := author_role $\neq$ Scrum Master $\wedge$ author_role $\neq$ Business Analyst $\Rightarrow$ MissingRole

list_tasks(n, m)

- output: out := A discord.embed such that it lists all the tasks of sprint m in project n, as well as their deadlines

rm_task(n, m, k)

- transition: rm_task(k) in sprint m in project n
- output: out := ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" | $\neg\ exc \Rightarrow$ "Successfully removed task")
- exception: exc := author_role $\neq$ Scrum Master $\wedge$ author_role $\neq$ Business Analyst $\Rightarrow$ MissingRole

Task Programs

add_feedback(n, m, k, s)

- transition: add_feedback(s) in task k, sprint m, project n
- output: out := ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" | $\neg\ exc \Rightarrow$ "Successfully added feedback")
- exception: exc := author_role $\neq$ Scrum Master $\Rightarrow$ MissingRole

get_details(n, m, k)

- output: out := A discord.embed such that it shows the details of task k, in sprint m, in project n, using get_details()

list_feedback(n, m, k)

- output: out := A discord.embed such that it lists all the feedback of task k, in sprint m, in project n, using get_feedback()

rm_feedback(n, m, k, x)

- transition: rm_feedback(x) for task k in sprint m in project n
- output: out := ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" | $\neg\ exc \Rightarrow$ "Successfully removed feedback")

- exception: $exc :=$ author_role $\neq$ Scrum Master $\Rightarrow$ MissingRole

set_details(n, m, s)

- transition: set_details(s) for task k in sprint m in project n
- output: $out :=$ ($exc \Rightarrow$ "MissingRole: You have insufficient permissions" $\mid \neg\ exc \Rightarrow$ "Successfully set details")
- exception: $exc :=$ author_role $\neq$ Scrum Master $\wedge$ author_role $\neq$ Business Analyst $\Rightarrow$ MissingRole

new Dict(T)		Dict(T)	
add	T		
remove	$\mathbb{N}$		KeyError
to_seq		seq of ($\mathbb{N}$,T)	

Semantics

State Variables

d: seq of ($\mathbb{N}$,T)
c: $\mathbb{N}$

State Invariant

$|d| \geq 0$
$c \geq 0$

Assumptions & Design Decisions

The Dict(T) constructor is called for each object instance before any other access routine is called for that object.

It is assumed that the first term in Dict is referred to as the "key" and the second term is the "value".

Access Routine Semantics

new Dict():

- transition: $d, c := \langle\rangle, 0$
- output: $out :=$ self

add(e):

- transition: $d := d \mid\mid \langle c,\ e\rangle, c := c + 1$

remove(id):

- transition: $d := d - \langle id, e\rangle$
- exception: $exc := \langle id, e\rangle \notin d \Rightarrow$ KeyError

to_seq():

- output: $out := d$ such that $(\forall i \in \mathbb{N} \mid 0 \leq i < |d| \cdot d[i].key() \leq d[i+1].key())$
